

What Function / role	Run by or utilizing what parts of the blueprint Types of interferences known to cause trouble	Overall level of function for our community prior to class Best pump to use for additional upgrade work
Nose The nose is the body's primary organ of smell and also functions as part of the body's respiratory system. Air comes into the body through the nose. As it passes over the specialized cells of the olfactory system, the brain recognizes and identifies smells. Hairs in the nose clean the air of foreign particles	Matter Energy Amplification Demon 2, 5, 8 Angel 2, 6 Alien: synthetic, snake Human/ghost 3 kinds Transmissions 16 Waves 13 Frequencies 8	30% average ~ 50% best ~ 11% worst Doorknob
Nasal Passages/sinuses (addition) Mucus may accumulate in and drip from the nostrils (runny nose) in these conditions. Infectious particles and allergens also impair cilia activity and can lead to symptoms such as a congested or runny nose. The thin walled veins on which the nasal mucosa rests function to warm air entering the respiratory passage. The sinuses lighten the skull or improve our voices, but their main function is to produce a mucus that moisturizes the inside of the nose. This mucus layer protects the nose from pollutants, micro-organisms, dust and dirt	Matter Energy Embodiment Demon 3 Angel 2, 6, 13 Alien: reptoid, synthetic, snake Human/ghost 3 kinds Transmissions 5 Waves 21 Frequencies 3	26% average ~ 36% best ~ 7% worst Chopping
Vocal chords (addition not part of respiration) Briefly, the vocal folds are folds of tissue located in the larynx (voicebox) that have three important functions: To protect the airway from choking on material in the throat. To regulate the flow of air into our lungs. The production of sounds used for speech.	Perception Matter Energy Genesis Embodiment Amplification	95% average ~ 100% best ~43% worst Doorknob

Pharynx It is commonly referred to as the throat. The pharynx is part of both the digestive and respiratory systems. For the digestive system, its muscular walls function in the process of swallowing, and it serves as a pathway for the movement of food from the mouth to the esophagus. Larynx The larynx houses the vocal folds, and manipulates pitch and volume, which is essential for phonation. It is situated just below where the tract of the pharynx splits into the trachea and the esophagus	Perception Matter Energy Genesis Demon 3, 8,11 Angel 3, 6, 11, 13 Alien: hybrid, snake Transmissions 3 Waves 5 Frequencies 11	29% average ~ 43% best ~13% worst Chopping
Trachea Trachea (Windpipe) The trachea (or windpipe) is a wide, hollow tube that connects the larynx (or voice box) to the bronchi of the lungs. It is an integral part of the body's airway and has the vital function of providing air flow to and from the lungs for respiration. Bronchi Bronchi: Anatomy and Function. The bronchi, singularly known as a bronchus, are extensions of the windpipe that shuttle air to and from the lungs. Think of them as highways for gas exchange, with oxygen going to the lungs and carbon dioxide leaving the lungs through them. Lungs The main function of the lungs is the process of gas exchange called respiration (or breathing). In respiration, oxygen from incoming air enters the blood, and carbon dioxide, a waste gas from the metabolism, leaves the blood. A reduced lung function means that the ability of lungs to exchange gases is reduced. Diaphragm The diaphragm separates the thoracic cavity, containing the heart and lungs, from the abdominal cavity and performs an important function in respiration: as the diaphragm contracts, the volume of the thoracic cavity increases and air is drawn into the lungs.
